

Where the tree puts its thresholds on x (note the different horizontal scales)

one decision every 1 step (sign change at $x = 0.00$)
first split on x : 100; no split kept: 0 (100 datasets)

one decision every 10 steps (sign change at $x = -0.92$)
first split on x : 86; no split kept: 14 (100 datasets)

first split second-level split -- planted $d = 0$ where the expected return over the holding period changes sign
